

AMENDMENTS TO THE CLAIMS

1. (CURRENTLY AMENDED) A remote control pan head system of a TV camera, comprising:

an operation part which outputs a control signal to a remote control pan head in which a camera is mounted, at least one of the remote control pan head and the camera being controlled with the control signal and said control signal being data for directly controlling at least one of the remote control pan head and the camera; and

a data converter which detects a data format of a communication data outputted from the operation part and converts the communication data outputted from the operation part including the control signal into a data format used in serial communication which conforms with a data format for the remote control pan head if the data format of the communication data differs from the data format for the remote control pan head, and transmits the converted communication data to the remote control pan head.

2. (CURRENTLY AMENDED) The remote control pan head system of a TV camera according to claim 1, wherein the data converter comprises a

recognition device which automatically recognizes a type of data format of the communication data outputted from the operation part.

3. (CURRENTLY AMENDED) The remote control pan head system of a TV camera according to claim 1, wherein the data converter comprises a switching device which is operated by a user to designate a type of data format of the communication data outputted from the operation part.

4. (NEW) The remote control pan head system of a TV camera according to claim 1, wherein the data format from the communication data outputted from the operation part is a bit-based communication.

5. (NEW) The remote control pan head system of a TV camera according to claim 1, wherein the data format from the communication data outputted from the operation part is a character-based communication.

6. (NEW) A remote control pan head system comprising:

an operation unit, said operation unit including at least two different operation parts that each output a distinct control signal to a remote control pan head in which a camera is mounted, at least one of the remote control pan head and the camera being controlled with the distinct control signal and said control signal being data for directly controlling at least one of the remote control pan head and the camera; and

a data converter which detects a data format of a communication data outputted from each of the operation parts and converts the communication data outputted from the operation parts including the control signal into a data format used in serial communication which conforms with a data format for the remote control pan head if the data format of the communication data differs from the data format for the remote control pan head, and transmits the converted communication data to the remote control pan head.

7. (NEW) The remote control pan head system according to claim 6, wherein the data converter comprises a recognition device which automatically recognizes a type of data format of the communication data outputted from the operation part.

8. (NEW) The remote control pan head system according to claim 6, wherein the data converter comprises a switching device which is operated by a user to designate a type of data format of the communication data outputted from the operation part.

9. (NEW) The remote control pan head system according to claim 6, wherein the data format from the communication data outputted from at least one of the operation parts is a bit-based communication.

10. (NEW) The remote control pan head system according to claim 6, wherein the data format from the communication data outputted from at least one of the operation parts is a character-based communication.

Amendment dated March 21, 2005

Reply to Office Action of October 21, 2004

11. (NEW) The remote control pan head system according to claim 6, further comprising a pan head, said pan head including
a TV camera,
a pan head control part,
a pan motor,
a tilt motor, and
a communication integrated circuit operatively connected to the pan head control part, wherein the pan head control part is operatively connected to the TV camera and controls an operation of the pan motor and the tilt motor.
